

CAN-AM RGB SIGNATURE TURN LIGHTS

Thank you for purchasing XTC Power Products. Our new Easy Install Kits are unique from the other kits on the market. This kit is completely Plug & Play, no wires to cut, no crimping with only power and ground. This kit will interface with our ATS and TSS turn signa systems so that your Signature lights can also be part of your Turn Indicator system. The Kit comes with 1 RGBW Controller with standard power cord, 1 Remote control, and one set of lights.

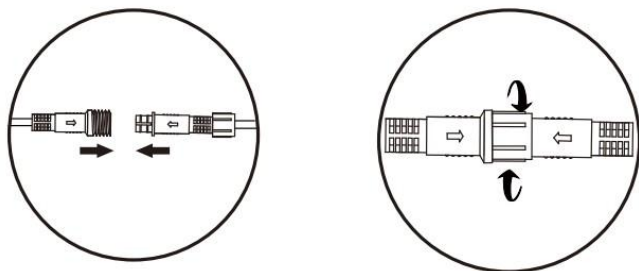

Read the instructions fully before starting the install

1. Attach the power cord to keyed power, or if using the optional Plug & Play adapter, plug it in the car.
2. Remove the grill from your vehicle.
3. Following the Manufactures directions, remove the right and left signature lights.
4. Install the new daytime running lights using the original hardware.

5. Mount the controller and plug power cord in.

6. Run the right power cable to the right light and the left cable to the left light and insert and screw on lock.
7. Plug the ATS Turn signal front harness into the Controller, green wire to the right/passenger side and yellow to the left/driver's side. When the turn kit is activated the signature light will flash amber.

The white wire is used to put the lights into white work light mode. Attach to power to trigger white mode.

8. Pull the plastic tab on the remote out to turn on the remote.

Note: The remote comes preprogrammed to the controller. If it does not operate the light or you have other devices you want to control push and hold the bottom right lock switch for 5 seconds. After it connects and works it can be relocked by holding the lock switch down once again.

Download the phone application on google play store or Apple. Search for PRO RGB and follow app instructions.
